ABSTRACT

The **Expense Tracker Web Application** is a full stack software solution designed to help users effectively manage, monitor, and analyze their daily financial activities. The main objective of this project is to provide a simple, user-friendly, and secure platform where users can record their income and expenses, categorize transactions, and gain insights into their spending habits. This system addresses the common problem of unorganized personal finance management by replacing manual tracking methods with a digital and automated approach.

The application is developed using modern full stack technologies, where the front end is responsible for providing an interactive and responsive user interface, and the backend handles business logic, data processing, and secure storage. Users can create accounts, log in securely, add income and expense details, edit or delete transactions, and view summarized financial information. Categorization of expenses enables better understanding of spending patterns, while visual representations such as summaries help users make informed financial decisions. The system ensures data security and reliability by implementing authentication mechanisms and structured database management. All user financial data is stored persistently, allowing access across multiple sessions without data loss. The modular architecture of the application makes it scalable and easy to maintain, enabling future enhancements such as budget limits, monthly reports, and advanced analytics.

Overall, the Expense Tracker Web Application demonstrates practical implementation of full stack development concepts including CRUD operations, user authentication, database integration, and client-server communication. This project serves as an effective learning model for understanding real-world web application development while providing a useful tool for personal financial management.
